- Exhibit D** Letter Request for Interview of Analyst
- Exhibit E** DPS Quality Incident Report
- Exhibit F** Spreadsheet with both Calibration Curves
- Exhibit G** DPS Quality Incident Report Revised

I. SUMMARY OF THE COMMISSION’S STATUTORY AUTHORITY

A. Legislative Background and Membership

The Texas Legislature created the Texas Forensic Science Commission (“Commission”) during the 79th Legislative Session by passing House Bill 1068 (the “Act”). The Act amended the Texas Code of Criminal Procedure to add Article 38.01, which describes the composition and authority of the Commission.¹ During subsequent legislative sessions, the Texas Legislature further amended the Code of Criminal Procedure to clarify and expand the Commission’s jurisdictional responsibilities and authority.²

The Commission has nine members appointed by the Governor of Texas.³ Seven of the nine commissioners are scientists or medical doctors and two are attorneys (one prosecutor nominated by the Texas District and County Attorney’s Association, and one criminal defense attorney nominated by the Texas Criminal Defense Lawyer’s Association).⁴ The Commission’s Presiding Officer is Jeffrey Barnard, MD. Dr. Barnard is the director of the Southwestern Institute of Forensic Science and the Chief Medical Examiner of Dallas County, Texas.

B. Accreditation Jurisdiction

The Texas Code of Criminal Procedure prohibits forensic analysis from being admitted in criminal cases if the entity conducting the analysis is not accredited by the Commission:⁵

“...a forensic analysis of physical evidence under this article and expert testimony relating to the evidence are not admissible in a criminal action if, at the time of the analysis, the crime laboratory conducting the analysis was not accredited by the commission under Article 38.01.”⁶

¹ See Act of May 30, 2005, 79th Leg., R.S., ch. 1224, § 1, 2005.

² See e.g., Acts 2013, 83rd Leg., ch. 782 (S.B.1238), §§ 1 to 4, eff. June 14, 2013; Acts 2015, 84th Leg., ch. 1276 (S.B.1287), §§ 1 to 7, eff. September 1, 2015, (except TEX. CODE CRIM. PROC. art. 38.01 § 4-a(b) which takes effect January 1, 2019).

³ TEX. CODE CRIM. PROC. art. 38.01 § 3.

⁴ *Id.*

⁵ Until the 84th Legislative Session, the accreditation program was under the authority of the Department of Public Safety (“DPS”).

⁶ TEX. CODE CRIM. PROC. art. 38.35 § (a)(4).

The term “forensic analysis” is defined as follows:

“Forensic analysis” means a medical, chemical, toxicologic, ballistic, or other expert examination or test performed on physical evidence, including DNA evidence, for the purpose of determining the connection of the evidence to a criminal action, except that the term does not include the portion of an autopsy conducted by a medical examiner or other forensic pathologist who is a licensed physician.⁷

The term “crime laboratory” is broadly defined, as follows:

“Crime laboratory” includes a public or private laboratory or other entity that conducts a forensic analysis subject to this article.⁸

The forensic discipline discussed in this report is blood alcohol analysis, which is subject to accreditation requirements under Texas Law.⁹ The laboratory that is the subject of this report, Texas Department of Public Safety El Paso Regional Crime Laboratory (“DPS” or “DPS El Paso”) is accredited by the Commission and the ANSI-ASQ National Accreditation Board (“ANAB”) under the International Organization for Standardization (“ISO”) accreditation standard 17025.¹⁰

C. Investigative Jurisdiction

Texas law requires the Commission to “investigate, in a timely manner, any allegation of professional negligence or professional misconduct that would substantially affect the integrity of the results of a forensic analysis conducted by a crime laboratory.”¹¹ The Act also requires the Commission to: (1) implement a reporting system through which a crime laboratory may report professional negligence or professional misconduct; *and* (2) require crime laboratories that conduct forensic analyses to report professional negligence or misconduct to the Commission.¹²

As part of its accreditation authority, the Commission may also:

⁷ *Id.* at § (a)(4).

⁸ *Id.* at § (d)(1).

⁹ Texas law exempts certain forensic disciplines from the accreditation requirement by statute or administrative rule. *Id.* at §(a)(4).

¹⁰ See <http://www.txcourts.gov/fsc/accreditation/> for a list of accredited laboratories.

¹¹ TEX. CODE CRIM. PROC. art. 38.01 § 4(a)(3).

¹² *Id.* at § 4(a)(1)-(2).

- establish minimum standards that relate to the timely production of a forensic analysis to the agency requesting the analysis;
- validate or approve specific forensic methods or methodologies; and
- establish procedures, policies and practices to improve the quality of forensic analyses conducted in this State.¹³

The Commission may, at any reasonable time, enter and inspect the premises or audit the records, reports, procedures, or other quality assurance matters of a crime laboratory that is accredited or seeking accreditation.¹⁴

D. Important Limitations on the Commission’s Authority

The Commission’s authority contains important statutory limitations. For example, no finding by the Commission constitutes a comment upon the guilt or innocence of any individual.¹⁵ The Commission’s written reports are not admissible in civil or criminal actions.¹⁶ The Commission has no authority to subpoena documents or testimony. The information the Commission receives during the course of any investigation is dependent upon the willingness of stakeholders to submit relevant documents and respond to questions posed. The information gathered in this report has *not* been subjected to the standards for admission of evidence in a courtroom. For example, no individual testified under oath, was limited by either the Texas or Federal Rules of Evidence (*e.g.*, against the admission of hearsay) or was subjected to cross-examination under a judge’s supervision.

II. INVESTIGATIVE PROCESS

This report contains observations and recommendations regarding an April 2018 complaint filed by Amanda Culbertson (“Culbertson”), a former crime laboratory supervisor, now a private

¹³ *Id.* at § 4-d(b-1).

¹⁴ *Id.* at § 4-d(b-2).

¹⁵ *Id.* at § 4(g).

¹⁶ *Id.* at § 11.

toxicology consultant (*See* Culbertson Complaint at **Exhibit A**). The Commission also received a request from the Texas Criminal Defense Lawyers Association to investigate the issues cited in the complaint. The Commission accepted the complaint for investigation and formed an Investigative Panel at its October 5, 2018 quarterly meeting. The Commission's Investigative Panel for this complaint includes Sarah Kerrigan, Ph.D., Jasmine Drake, Ph.D., and Mark Daniel, Esq.

A. Documents Reviewed and Interview Request

The Investigative Panel and Commission staff reviewed documents provided by Culbertson and DPS, including 120 pages of blood alcohol batch logs (instrument logs) and associated case chromatograms ranging from 2012 through 2017. Other documents reviewed included: PowerPoint presentations by Culbertson and DPS (*See* **Exhibits B-C**), quality incident reports from DPS (*See, e.g.*, **Exhibits E and G**), and calibration curve data from the referenced cases. The Investigative Panel also requested an interview with the DPS analyst through her attorney (*See* **Exhibit D**) but did not receive a response.

III. FACTUAL ALLEGATIONS

A. Summary of Allegation

The complaint alleges Ana Romero, a blood alcohol and seized drug Analyst ("Analyst") formerly employed by DPS El Paso, intentionally falsified data in 28 of 32 blood alcohol cases run in a single batch. The complainant asserts there is sufficient evidence to conclude the error constituted professional misconduct.

B. Facts Not in Dispute

The Analyst began running the batch in question on Friday, February 7, 2014. Within a few hours of beginning the run, which occurred mostly over the weekend, the helium tanks

supplying the carrier gas ran dry. The affected batch contained 107 headspace vials, 64 of which were vials in duplicate containing defendant samples, amounting to 32 individual defendant cases. On Monday, February 10, 2014, the Analyst restarted the batch. The Analyst allowed the batch to run until completion on February 11, 2014. The DPS standard operating procedure at the time did not prohibit the use of data from a run for which gas was depleted and replaced. The Analyst printed the results on February 21, 2014. She then issued reports for the cases in question and sent them for technical review to the DPS Midland regional laboratory. The technical reviewer in Midland rejected the data from the February 10, 2014 run and instructed the samples be re-analyzed. His rationale for rejecting the data was that the best practice under the circumstances was to re-run the samples due to the carrier gas depletion.

C. Facts in Dispute

Based on chain of custody documents, DPS asserts that on March 12, 2014, the Analyst took possession of the entire batch again for the purpose of re-analyzing it. The method blanks, calibrators and control area counts were different from February to March, suggesting she re-ran at least the blanks and a few of the samples. The instrument log indicates the instrument collected and analyzed 108 data files on March 12, 2014 in 13-minute increments from the batch in question. However, the data for 27.5 of the 32 defendants' cases (55 vials of the 64 total defendant vials) were identical to the February 11, 2014 data. Further, one defendant's case had identical data to the previous runs but the order was reversed (data from the first batch, aliquot 1 appeared as the data for the second batch, aliquot 2).

DPS was unable to locate the data for the 28 cases that should have been generated from the re-analysis on March 12, 2014. There were no hard copy printouts of the data in the case files either.

The complainant believes the use of the February data for what should have been the new March run was an intentional act by the Analyst to avoid the extra work involved with re-analyzing the blood alcohol a second time as instructed by the technical reviewer. The complainant further asserts the erroneous use of February data should have been identified by the technical reviewer during the second technical review. The complainant believes the following factors weigh in favor of a conclusion that the act was deliberate:

- 1) The Analyst made a copy of at least one data file and placed it into a different folder.
- 2) She manually entered the reprocessing range omitting the calibrator.
- 3) She reprocessed one case numerous times, going back and forth between February and March. This may indicate she was trying to reassure herself that the results would not be impacted by using the February data instead of re-running the cases.
- 4) The data for 28 cases in the March run were deleted, but data files still exist for runs before and after that date.

DPS agrees with the complainant that: (1) the data described in the complaint is a near statistical impossibility; (2) the Analyst used the February data instead of data that should have been generated from a second run in March; and (3) this error should have been caught during technical review. The technical reviewer did not check the peak areas on the re-run and likely only confirmed the concentration was difference between the two runs. As a result, he did not detect the use of the February data for the March run.

With respect to the Analyst's intent, DPS has consistently asserted "there was not an intentional or malicious action on the part of the Analyst" while recognizing the laboratory "could not definitively exclude the possibility that the actions on the part of the Analyst were intentional." For this reason, the laboratory ultimately determined that no conclusion could be reached with respect to the Analyst's intent and thus declined to attribute the root cause to professional

misconduct by the Analyst. DPS also points to the following as indicators that an unintentional mistake in data selection was possible:

- 5) **Instrument Software Limitations.** The software used at the time of the incident allowed the user to manually select a data file and did not update the upper header on the report or identify the calibration file used. There was nothing present in the software to prevent the user from accidentally switching data files. DPS acknowledges this limitation in the software could be associated with either accidental error or intentional error.
- 6) **Analyst Data Analysis Process.** Twenty-eight cases did not receive chromatograms. The software generated reports without user interface. DPS could not determine whether the reports printed and if so what happened to the printed data; however, the instrument log captured the Analyst manually initiating an analysis process to re-obtain the data and print/re-print the chromatograms. The laboratory did not initiate this process often, and thus the Analyst could have made an error when attempting to perform the function.
- 7) Another analyst was running a batch at the same time the Analyst was attempting to process and print the data from the March run. This could have been a complicating factor in the selection of the appropriate data set by the Analyst.
- 8) The laboratory reviewed a representative sample (315 cases from 85 batches) of the Analyst's casework spanning 2009-2014. No other cases with duplicated area counts were identified.

D. Analyst Disclosure History

The Analyst that is the subject of this complaint and investigation was the subject of a separate self-disclosure by DPS in 2014 in which she cut and pasted incorrect information in a worksheet for a controlled substance analysis and a controlled substances report was issued to a customer with an incorrect net weight due to the error. The error was discovered when the law enforcement agency notified the laboratory that the net weight was not what it had expected, and the laboratory re-analyzed the evidence. The law enforcement customer had not yet reported the results to the prosecutor so the defendant's case was not impacted by the error. In response to the error, DPS reviewed 100 of the Analyst's cases to verify the weights and determine whether there was a pattern of similar errors. The Commission took no further action on the disclosure given the actions taken by the laboratory in response to the nonconformity, including the laboratory's review

of the Analyst's casework, implementation of preventative measures including a "locked-down" worksheet that prevents any future copy/paste issues and continued re-analysis and evaluation of cases. The disclosure did not mention that the Analyst was also performing blood alcohol analysis at the time.

IV. COMMISSION OBSERVATIONS AND FINDINGS

A. Additional Inquiries of DPS

After review of the materials provided by the complainant and DPS's initial response, the Investigative Panel requested DPS provide an analysis of the data showing both calibration curves from the February and March runs. DPS compared the linear regressions from the February and March calibrations. (*See Exhibit F.*) The laboratory used area counts from the February batch to calculate the concentration using the original curve. The laboratory used area counts from the March batch (most of which match the February 7, 2014 information) to calculate the concentration using the curve from March. The spreadsheet calculates the percentage difference between the two sets of results to show the difference between the two curves. A comparison of the concentrations using each curve yields a difference so small as to be insignificant. Thus, the Analyst's use of the February data to support the March run would not have had an adverse impact on any defendant's blood alcohol result.

The panel further requested that DPS attempt to recreate the accidental selection of the wrong data set using the computer and software from the El Paso laboratory. However, DPS was unable to reproduce this scenario because the instrument was not recovered. Without the instrument, the system's technology integration specialist could not reproduce how the software would react while reprocessing and collecting data at the same time. As previously stated, a sequence from another analyst was running and collecting data at the same time the Analyst was

reprocessing the March 14 batch. When reprocessing a sequence, the computer defaults to the original results unless the user selects “reintegrate.” The results would then be calculated using the calibration saved in the method. From the software logs and menu choices, it is not unreasonable to conclude that a calibrator from a different run could be used accidentally to process the current run if “reintegrate” were chosen when reprocessing the sequence and the calibration was previously saved to the method. However, there is no way to definitively determine what the Analyst knew about her file selections at the time, or what her underlying intent was in making the choices she did. She told DPS during an interview that she had no recollection of the specific batch in question, that the software was not user-friendly, and the printing function did not always work properly. As previously stated, the Analyst has not responded to requests from the Commission for an interview, and she has no obligation to consent to one considering she is no longer a forensic analyst in Texas. DPS also provided a revised/supplemental quality incident report in response to the Investigative Panel’s requests. (*See Exhibit F.*)

B. Assessment re: Professional Negligence or Misconduct

Article 38.01 of the Texas Code of Criminal Procedures requires the Commission to describe whether professional negligence or misconduct occurred in this case. The Commission has defined both terms in its administrative rules.¹⁷

“Professional Misconduct” means the forensic analyst or crime laboratory, through a material act or omission, deliberately failed to follow a standard of practice that an ordinary forensic analyst or crime laboratory would have followed, and the deliberate act or omission would substantially affect the integrity of the results of a forensic analysis. An act or omission was deliberate if the forensic analyst or crime laboratory was aware of and consciously disregarded an accepted standard of practice.

“Professional Negligence” means the forensic analyst or crime laboratory, through a material act or omission, negligently failed to follow the standard of practice that an ordinary forensic analyst or crime laboratory would have followed, and the negligent act or omission would substantially affect the integrity of the results of a forensic analysis. An act or omission was negligent if the

¹⁷ See 37 TEX. ADMIN. CODE §15.

forensic analyst or crime laboratory should have been but was not aware of an accepted standard of practice.

The professional misconduct definition requires the Commission to establish a deliberate (*i.e.*, intentional) act or omission before issuing a finding of misconduct. Without speaking with the Analyst, the Commission finds the evidence insufficient to reach a conclusion of professional misconduct. The investigative panel agrees with DPS' ultimate conclusion that it is not possible to determine whether the Analyst re-used the February data intentionally or accidentally. However, the panel believes DPS' original root cause analysis did not sufficiently consider this possibility, instead defaulting to the assumption that she must not have acted intentionally.

The investigative panel agrees with the complainant that the log showing the Analyst moving back and forth multiple times between February and March data could be an indicator she was attempting to reassure herself that using the February data would not affect the reported conclusions. In such a case, she could have run blanks for the 28 cases and discarded the data generated from those blank runs. This would have saved her the time and effort of having to re-aliquot blood for 28 cases in duplicate (56 vials). To be absolutely clear, the Commission is not stating this is what actually happened, but the possibility should not be dismissed out of hand. While the Commission endeavors to reach a clear conclusion regarding professional misconduct in all investigations, some factual scenarios simply do not allow for it. This is one of those cases.

Assessing professional negligence is necessarily difficult because it is a contextual-driven analysis dependent on the weight accorded various factors. In this case, DPS issued 28 reports with incorrect supporting data and the laboratory did not realize it had done so until almost five years later when the complainant reviewed the data in a case for which she was hired as an expert. The Commission concludes this failure constitutes negligence because none of the mechanisms in the laboratory established to protect against this type of error (*e.g.*, analyst attention to detail, thorough

technical review by a second qualified analyst) prevented the reports from being issued. Issuing results with the wrong supporting data is a failure to follow the standard of practice that an ordinary forensic analyst or crime laboratory would have followed. Because DPS later had no choice but to announce it could no longer support the results in 28 cases, the negligent act or omission did substantially affect the integrity of the results of a forensic analysis.

V. CORRECTIVE ACTIONS AND RECOMMENDATIONS

For the 28 cases in which no March run data exists, DPS has informed stakeholders it can no longer support the reported blood alcohol results. This decision was appropriate given the circumstances, even when taking into consideration the fact that the use of the February data would not have changed the reported results in those cases based on the subsequent comparison of the two calibration curves (*See Exhibit F*).

The software mechanism that allowed the Analyst to manually select a data file no longer exists, thereby eliminating the possibility that the wrong data could be selected accidentally.

With respect to the retroactive reviews performed by DPS as a result of this case, the Commission recommends DPS refer to the statistical sampling guidance posted on the Commission's website. DPS should also continue to consult with Dr. Cliff Spiegelman, Distinguished Professor of Statistics at Texas A&M University, to ensure the sampling plan utilized to date is sufficient given the observations with respect to the Analyst's intent set forth in this report.

Finally, the Commission found the quality incident documentation related to this case extremely difficult to follow. Having reviewed many DPS quality incident documents from various regional laboratories over time, the Commission makes the general observation that quality system documentation has become more complete. However, there is significant variation within the

laboratory system with respect to how clearly the documentation: (1) describes the facts; (2) describes the root cause; and (3) describes corrective and preventative action. The Commission suggests DPS provide training to quality assurance personnel on effective drafting, including the avoidance of passive voice whenever possible. Otherwise, the reader is left to make assumptions regarding ambiguous language, which risks creating confusion instead of providing clarity with respect to a given factual scenario.

TEXAS FORENSIC SCIENCE COMMISSION • COMPLAINT FORM (*Cont.*)

4. DESCRIPTION OF COMPLAINT

Please write a brief statement of the event(s), acts or omissions that are the subject of the disclosure.

Please see the attached

TEXAS FORENSIC SCIENCE COMMISSION • COMPLAINT FORM (*Cont.*)

5. EXHIBITS AND ATTACHMENT(S)

Whenever possible, disclosures should be accompanied by readable copies (**NO ORIGINALS**) of any laboratory reports, relevant witness testimony, affidavits of experts about the forensic analysis, or other documents related to your disclosure. Please list and attach any documents that might assist the Commission in evaluating the complaint. Documents provided will **NOT** be returned. List of attachments:

- 1) "Original Complaint"
 - 2) "March 12, 2014 Batch"
 - 3) "Second Complaint"

6. YOUR SIGNATURE AND VERIFICATION

By signing below, I certify that the statements made by me in this disclosure are true. I also certify that any documents or exhibits attached are true and correct copies, to the best of my knowledge.

Signature: Amanda Culbertson
Date Signed: 26/10/18

Summary of complaint:

Generally, failure to adhere to accreditation standards and Laboratory Operations Guidelines (LOG) such as failure to promptly notify customers of non-conforming work and failure to timely issue corrective actions for non-conforming work. Additionally, failure to define the “peer review” process (which is different than a technical review) in either a SOP or quality manual.

Background:

This complaint centers around the cases and blood alcohol batches described in another complaint I submitted simultaneously with this complaint which is attached for reference.

A Quality Incident Report (QIR) with tracking number QI-ELP-2017-0831-BA was issued in response to the March 12, 2014 batch referenced in the previous complaint. This QIR discussed the problems seen in this batch observed during the “peer review” process (reviewing a case to be able to provide “surrogate testimony”). Specifically, Laura Hernandez, the person conducting the peer review stated that data for 3 controls were “listed incorrectly on the batch log.” She went on to state that “the concentrations reported for line 107 are actually the concentrations for line 108 . . . in addition, the last control that was analyzed was not present on the log . . . on closer inspection by LH, it appears that the concentration for one of the samples belonged to the missing control sample.” The QIR concluded that all of this was due to a simple “transcriptional error.”

Missing control samples, logs that do not align with the data that is generated, and “transcription errors” should have been a red flag to investigate this issue further. Since the QIR stated that this was a peer review and “all data pages were present,” it would appear that the case folder — which should have contained the chromatograms from both February 7 and March 12, 2014 — was available for review. As stated in the other complaint, the activities of Ana Romero should have been caught both during the initial review and subsequently in this “peer review” process which, even according to Ms. Hernandez, was “really thorough.”

According to the QIR, these problems were first identified in August 2017. However, defense counsel for at least one of those cases whose client’s case was still pending and might possibly have even necessitated the peer review, was not notified of any potential issue when first identified in August 2017 or thereafter. This particular case was scheduled for trial in January 2018, a fact the peer reviewer, who was reviewing for the purpose of providing surrogate testimony, would have known. However, the QIR itself shows that the customers were not notified.

Finally, the QIR listed some, but not all of the cases in this batch. The author could have listed the batch by precise file name to alert anyone with cases in this batch to the problems described or provided every case identifier. Instead, only select cases were listed (or shown on the printed QIR). The case for which I was retained was in this batch with these samples but was NOT listed on the QIR.

Another, somewhat unrelated QIR, QI-ELP-2017-0608-BA, was finalized in January 2018. The subject of this QIR was an “unexplained glitch in the computer software” that caused the instrument to

“miscalculate[] the concentration of two controls . . . [that resulted in] the numbers [being] off to a degree that the standard would not qualify as acceptable.” According to the QIR, an amended report was issued in November 2017 – 5 months after this issue was discovered. This is in violation of the Laboratory Operations Guidelines which state “the report and/or certificate should be amended as expeditiously as possible within ten business days from the date the results were confirmed to be incorrect. A longer timeframe for amended reports may be allowed if there is documentation that the relevant customers have been notified.” As with the previous QIR, it does not appear that the customers (beyond the one case referenced) were notified of this “glitch” that causes miscalculations.

In light of the events described in both this complaint and the other complaint submitted contemporaneously, it is also important for the Commission to be aware of concerning statements made by Laura Hernandez during the November 2017 Southwestern Association of Forensic Scientists (SWAFS) meeting. During her presentation, Ms. Hernandez began discussing a specific but unidentified case that had “200 pounds of baggage.” In regard to this case, she made it very clear that the issues described had not been relayed to the defense or prosecution. When asked if she would feel comfortable testifying on a case that had so many problems, she indicated that in such situations she preferred a pre-trial meeting with the prosecutor, “especially” in cases where peer review was involved and “the law is not quite there yet.” She further indicated that she liked to have a pre-trial meeting with the prosecutor, to make them aware of the issues so that they can “preemptively lay that out” in court. She never once, however, indicated that such information was disclosed to the defense.

Also during her presentation, which was a “how to” on testifying to cases in which one did not perform any testing, she made the following comment: “dry-benching, dry-labbing, or just falsifying records – like that happens, unfortunately, I wish it didn’t — it would make my job so much easier if I could say that I was, you know, truly in a reliable place.” Despite this, I have seen no corrective action, Quality Incident Report (QIR), or any other disclosure to defense bar or the Texas Forensic Science Commission regarding instances of dry-labbing or falsifying records.

It is my hope that the Commission will investigate these issues.

Date Signed: 10/10/18

Summary of the Complaint:

An employee of the Texas DPS El Paso Regional Crime Lab reused previously analyzed defendant data and appears to have gone to considerable lengths to pass said data off as having been generated at a different time than what actually occurred. This should have easily been caught by the technical reviewer, but seemingly went unnoticed. The ability of the analyst to perform this act and the apparent lack of detection (or possible complicit acceptance) by lab personnel demonstrates a breakdown of the laboratory's quality system.

Background:

I had been hired by a defendant and his counsel to review a blood alcohol case occurring between February and March 2014. The data in this case was first analyzed by Ana L. Romero on Friday, February 7, 2014. The batch in which this case was analyzed consisted of a total of 107 headspace vials with 64 being defendant samples/vials (in duplicate; 32 individual defendant cases). According to the documentation, within a few hours of starting this run, the helium tanks supplying the carrier gas ran dry. On Monday, February 10, 2014, the batch was restarted with no leading calibrator or control. The batch was allowed to continue to run until completion on February 11, 2014.

The "Alcohol Analysis Worksheet" for this case showed that the data for the run beginning February 7, 2014 was not used due to the gas cylinder being replaced during the run. The "Blood Alcohol Batch Log" noted that the data for this run **would not be used** and that **all** samples would be resampled and rerun.

On March 12, 2014, the entire batch from February 7, 2014 was allegedly reanalyzed in its entirety and exact sequential order. It appeared that new calibrators, controls, and method blanks were prepared and analyzed. However, the data for 27.5 of the 32 defendants' cases (55 vials of the 64 total defendant vials) were **identical** to the data generated on February 7 – 11, 2014.¹ Furthermore, one defendant's case had identical data (area counts) to the previous run but the order was reversed (data from the first batch, aliquot 1 was now appearing as the data for the second batch, aliquot 2).

The chances of analyzing another sample that results in all 7 digits of the area counts of the internal standard being identical to any other case, in any other batch, is extremely low. Having all 7 digits of the internal standard area counts and all the area counts for acetaldehyde, ethanol, acetone, methanol, and other unidentified peaks (when detected) being identical to a previous run for 55 out of 64 defendant samples is beyond measure. In other words, there is no way that what was seen in these two batches is the result of coincidence or a random event.

¹ More specifically, the area counts for all peaks, identified or not, were identical for the cases mentioned. The actual reported results for each sample were different between the first run in February 2014 and the second run in March 2014. This, however, is easily explained because a new calibrator – which results in a new calibration curve (i.e. equation) – was used in the March 2014 run. By using the identical area count ratios in a new equation (re-processing), this resulted in a new reported result, despite the underlying data (area counts) being the same data from a previous run.

It is my opinion — as someone with years of experience with this type of analysis on similar instrumentation/software, in consultation with the software manufacturer's support personnel, and viewing the raw data from the February 7, 2014 run on the manufacturer's software — that the acts described herein are not due to accident or negligence, but an intentional act on the part of the analyst.

Furthermore, comparing the Blood Alcohol Batch Log from the February 7, 2014 run with the same log from the March 12, 2014 run, both were technically reviewed by the same person and on the same date: March 21, 2014. Because this technical review analyst appeared to have reviewed both batches and all chromatograms, including those from the failed run simultaneously, this act should have been caught. The fact that it was not seriously undermines the credibility of the technical review process and the quality system as a whole.

It is my sincere hope that the Texas Forensic Science Commission conducts a thorough review of this situation.

Alcohol Analysis Worksheet

LAB-BA-01 Rev.02 (11/2012) p.1 Issued by: QAC

Lab Case # ELP-1312-02098

Analyst Ana Lilia Romero

Date Started 2/7/2014

Date Completed 2/12/2014

Evidence

Subject's Name (Submission form): [REDACTED]

Evidence Container:

Box

Tube

Envelope

Other _____

Specimen: Gray Top Other _____

Sealed: Yes No

Specimen Label: None Same as Submission Form

Type/Amount

X Blood	X Normal	Condition		
		<input type="checkbox"/> Thick	<input type="checkbox"/> Clotted	
Urine	Other			
Serum		<input type="checkbox"/> Full	<input checked="" type="checkbox"/> 3/4	<input type="checkbox"/> 1/2
Vitreous		<input type="checkbox"/> Other	<input type="checkbox"/> 1/4	<input type="checkbox"/> <1 mL
Other				

Additional Notes

BTM Box (Sealed)->centrifuge tube->absorbent-->
---->blood tube

*Gas cylinder replaced during run

*Associated QC and Calibration records are maintained in appropriate logbooks.

Measurement Uncertainty (at 99.7% confidence):
Reported Ethanol Result \pm (9.4% * Reported Ethanol Result)

Results

Reported Ethanol Result: **0.172** grams per **100** mL

0.1741 0.1716

0.1734 0.1705

Data not used*

Other Volatiles:

Acetaldehyde, Acetone

Disposition

Drug Screen Request:

Yes No

Not sent for drug screen; alcohol content \geq 0.100g/100mL

Disposition Note:

Retain

Drug Screen

Return

Other _____

Analysis Method

Heated Head-Space Gas Chromatography

Sample Preparation:

200 ul specimen with 1400 ul internal standard solution (0.016 g/100 ml n-Propanol/4.3 M NaCl) in a sealed 20 ml headspace vial

Instrument:

Thermo Scientific Trace GC Ultra/TriPlus HS (SN: 320080876)

GC Columns:

A Rtx-BAC1 30 meters 0.53mm i.d. 3 μ m film

B Rtx-BAC2 30 meters 0.53mm i.d. 2 μ m film

Column Conditions:

Oven Temperature	*SEE NOTE*
Column Flow Rate	10 cc/min
Injection Temperature	200 °C
Detector Temperature	240 °C

Autosampler Program:

Sample Temperature	80 °C
Syringe Temperature	85 °C
Injections per vial	1
Thermostating Time	5 min

*NOTE: Oven temp 40 C (6.5 min), 20 C/min, 70 C(2min)

Internal Standard Area Counts*

Colored cells indicate identical area counts

*For the cases in the colored cells, area counts for any other detected peak are also identical.

The internal standard was chosen for comparison for the sake of brevity.

TEXAS DEPARTMENT OF PUBLIC SAFETY
CRIME LABORATORY
Quality Incident Report
LAB-QA-04e (05/2017)p.1 Issued by: QAC

Tracking ID

QI-ELP-2017-0608-BA

Lab	El Paso	Discipline	BA	Date Discovered	6/8/2017	Page 1 of 1
Date of Incident	9/28/2013	End Date of Incident (if applicable)			9/28/2013	
Related Policy/Procedure/Specification	BA-02-01					
Related Work # (case/batch/instrument)	ELP-1309-01569					

Incident Description:

During a peer review, BA analyst LH noticed that the instrument miscalculated the concentration of two controls used in a batch (0.100 and 0.300 were used). LH verified by manually calculating the concentration using the area counts of the instrument. In the case of the 0.100 standard, the numbers were off to a degree that the standard would not qualify as acceptable. Since this was an error that was only seen by doing the manual calculations, LH pulled every case analyzed in the batch and found one case where this error occurred (case number ELP-1309-01569). In that case, because of the difference in the concentration, it changes the reported value from 0.149 to 0.147. The remainder of the cases in the batch were not subject to the same error.

Cause Analysis:

The cause was determined to be the result of a unexplained glitch in the computer software that was not observed in other cases in the batch. The error has not been observed in any other cases outside the batch, and since the affected instrument was removed from service in 2014, the incident is not expected to reoccur. Routinely, manual calculations are not performed to verify calculations initially performed by the computer software. This contributed to the amount of time between when the incident occurred and when it was discovered during a peer review.

Involved Parties (who by direct actions caused the quality incident):

Not Applicable

Correction(s) to the Original Work (Indicate if not performed at this time)

Corrected Report? Yes

Because of the difference in the concentration, the reported value changed from 0.149 to 0.147. Since there is an acceptable standard on each end of the run, the batch still passes. An amended report was generated for ELP-1309-01569 noting this difference and was released as of 11/27/17. Since the technology leading to this incident is no longer utilized in current cases, and the difference observed was not significant enough to alter the outcome on the case, no further action is needed.

Customer Notification (Indicate if not performed at this time or not applicable):

Amended report released to client as of 11/27/17.

Corrective Action Necessary? No

Significant Disclosure? No

Incident Description:

During a peer review BA analyst LH noticed that the data for three samples (Volatile mixture (line 3 of the batch log), Control sample (0.08 ethanol standard from Lipomed lot 14112011-A), and Control sample (0.08 ethanol standard from Cerillinat lot FN011712-02)) was listed incorrectly on the batch log. Specifically, the concentrations on the data pages were incorrectly transcribed for the volatile mixture (line 3) and the 0.080 control (line 107). In addition, there is data for an additional 0.080 control analyzed in position 108 and it is documented on a batch summary but it does not appear in the batch log. Furthermore, the concentrations reported for line 107 are actually the concentrations for line 108. In addition, the last control that was analyzed was not present on the log. On closer inspection by LH, it appears that the concentration for one of the samples belonged to the missing control sample.

Cause Analysis:

Since the data pages are correct and the analyst at the time typed the alcohol concentrations into the batch log file, LH concluded that this incident appears to be due to a transcriptional error made by the original analyst Ana Romero in typing the values from the data pages to the batch log. The error only affects the batch log; not the data or the results.

Involved Parties (who by direct actions caused the quality incident):

Not Applicable

Correction(s) to the Original Work (Indicate if not performed at this time)

Corrected Report? NA

The alcohol concentrations on the data pages were verified correct by LH and all data pages were present. LH verified that the data pages have correct information and the report lists the correct information. It is only the batch log that contains the error, and it appears to be transcriptional in nature. The information on the report was correct. LH manually calculated the results and verified their accuracy. Since there was no error in the reported alcohol concentration in the case, there is no need to have an amended report. This case was originally analyzed at a time when more manual entries were required for blood alcohol analysis. Since the time of testing, there have been steps made to automate the entry of results. This automation helps to limit these types of errors.

Customer Notification (Indicate if not performed at this time or not applicable):

N/A

Corrective Action Necessary? No

B

Presentation to the Screening Committee
Texas Forensic Science Commission
October 4, 2018

AMANDA CULBERTSON, MS, JD

How it should work

- Calibration curve established
- At the time, DPS used a 1-point calibration curve
- Blood alcohols analyzed in duplicate (aliquot 1, aliquot 2)
- Chromatograms are printed at the conclusion of every sample
- Printed chromatograms are placed in case folders
- Cases are technically reviewed

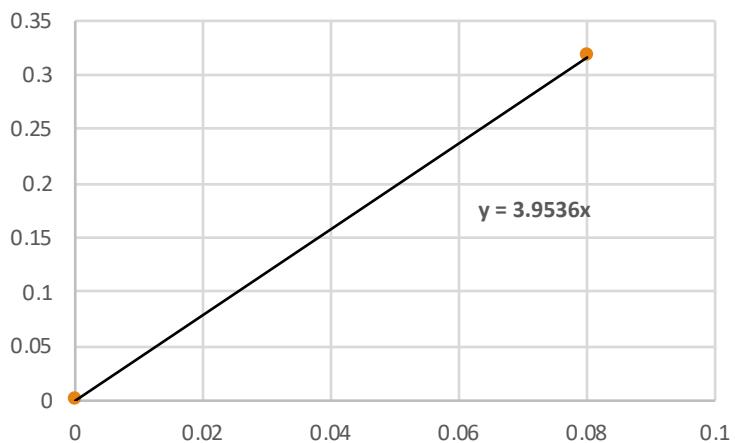

With a 1-point calibration curve, there should be no need to reprocess (aka re-analyze)

You can reprint chromatograms WITHOUT re-analyzing the data

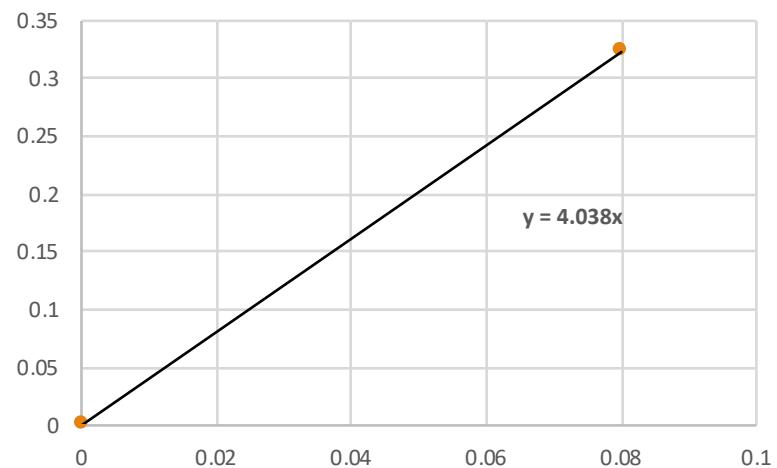

When you hear calibration curve, think equation:

- $y = mx + b$

February 2014 Calibration Curve

March 2014 Calibration Curve

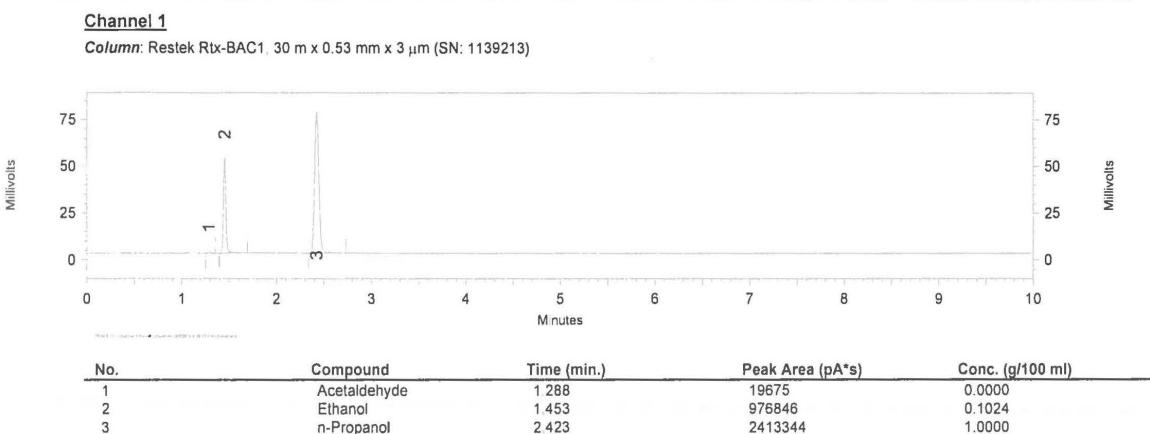

Reanalyze: Takes existing data and plugs it into a new calibration curve (equation)

Printing Custom Reports

You can print custom reports in one of four ways:

- From within the Custom Report editor. To print a report from the Custom Report editor, use either the Print button in Print Preview, or print the report directly by right-clicking and choosing **Print** from the shortcut menu.
- To print the current custom report, choose **Reports > Print > Custom Report** from the menu bar.
- As a part of data acquisition or reprocessing. A custom report can be printed at the end of each analysis, at the end of a data acquisition run, and during or at the end of a sequence. Selecting the Print Method Reports option when starting a run, sequence acquisition, or reprocessing determines whether or not a method custom report is printed. No reports are printed unless this option is selected. Sequence reports are not printed unless the Print Sequence Reports option is selected.
- From a sequence run. In the Run Type, select the **Print additional reports** check box. Use this option to select report templates to print and to specify when you want the report or reports to print.

Note When opening an instrument **online**, the configured printer is remembered for that instrument regardless of the user. When opening an instrument **offline**, the configured printer is remembered for the user of that instrument.

Figure 242. Sample Run Type(s) window

How it actually worked (??)

Explained by Brady Mills at last meeting

Explained in further detail in QI-ELP-2018-419-BA

Many unanswered questions in QI on what exactly happened

Yet, still concluded - accidental

What was said

Data from February reused in March

Electronic data missing for all but 2 injections (should have been 108 total injections)

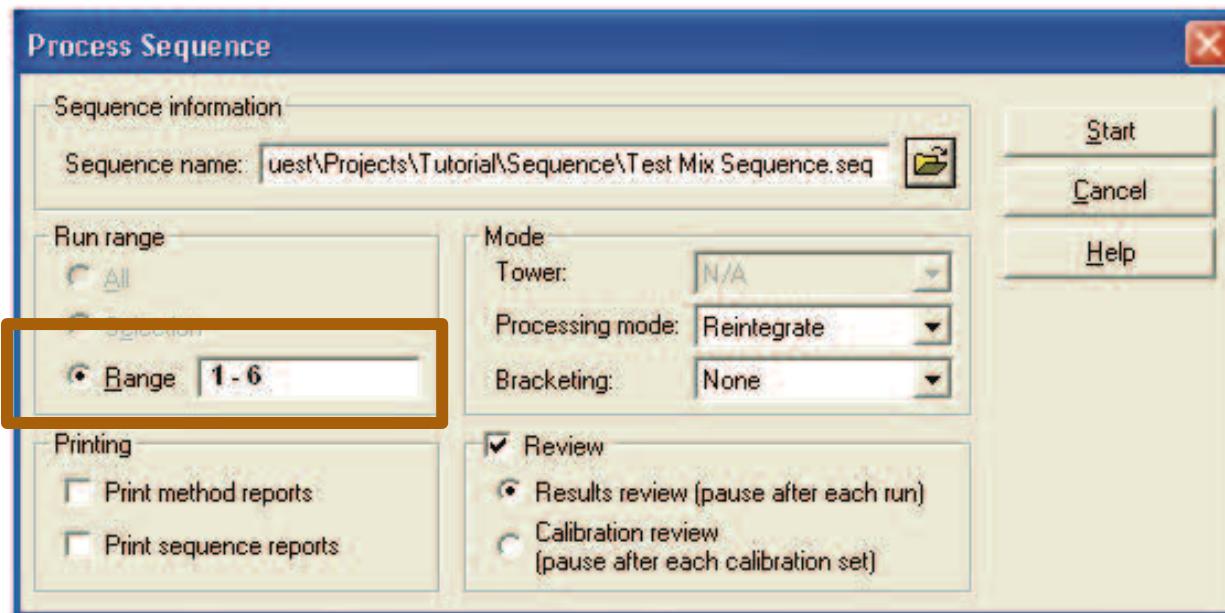

Hard copy (paper) data was missing for all but 4 cases but calibrator and controls present

Therefore, 28 cases were missing hard data ($28 \times 2 = 56$ pieces of paper)

Needed to reprint (NOT reprocess)

QI-ELP-2018-419-BA

"It appears she re-analyzed the entire 2/7/2014 run but excluded vials 1 and 2. Then she analyzed one sample three times from the March run and then the same sample twice from the February run. Then, she analyzed all of the 3/12/2014 samples including vials 1 and 2 twice."

QI-ELP-2018-419-BA

Their hypothesis contemplates 2-steps:

- 1) “It is possible during that entry that the analyst manually selected to apply the data set from 2/10/14 instead of the data set from 3/12/14.”
- 2) “The analyst could have then had the software perform the analysis process against the wrong 2/10/14 data set using the correct 3/12/14 data file .”

In other words, at some point the February data set must be “incorporated” into the March data set (by “right-clicking” on the graph and data and choosing wrong data set) AND the old data must be reprocessed.

Essentially – 2 different accidents must occur

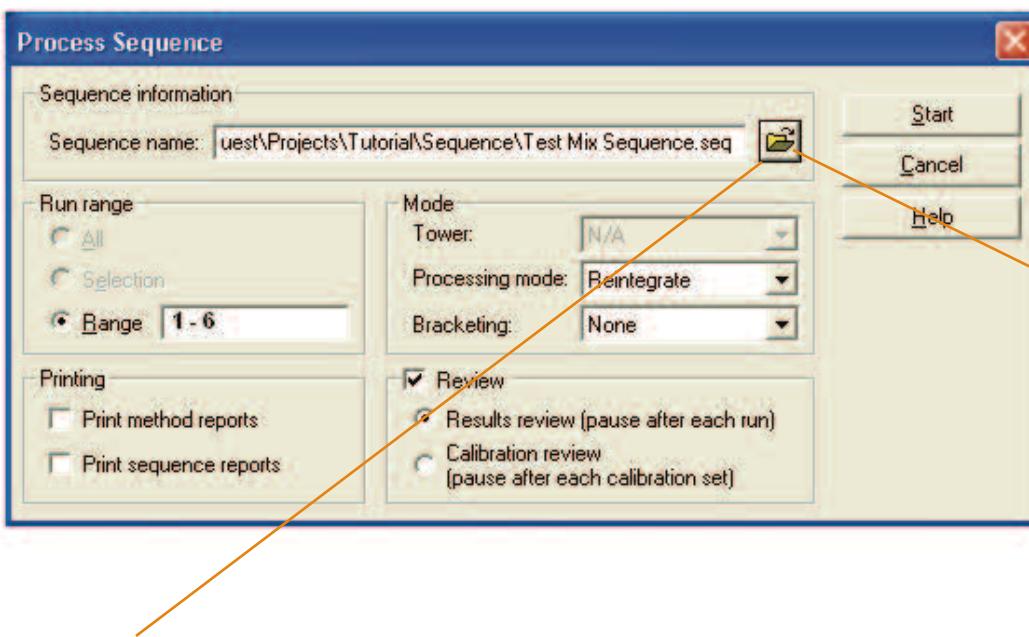

What they didn't say

Between 2/7/14 and 3/12/14, Romero had 2 completed runs and 1 partial run

These runs were dated 2/28/14, 3/7/14, and 3/11/14

Every time she “accidentally” grabs the wrong data, she must overlook several other data sets

4	Ethanol	1.452	2617275	0.2617
5	n-Propanol	2.422	2476913	1.0000

Presentation to the Screening Committee Texas Forensic Science Commission January 8, 2019

AMANDA CULBERTSON, MS, JD

How it should work

- Calibration curve established
- At the time, DPS used a 1-point calibration curve
- Blood alcohols analyzed in duplicate (aliquot 1, aliquot 2)
- Chromatograms are printed at the conclusion of every sample
- Printed chromatograms are placed in case folders
- Cases are technically reviewed

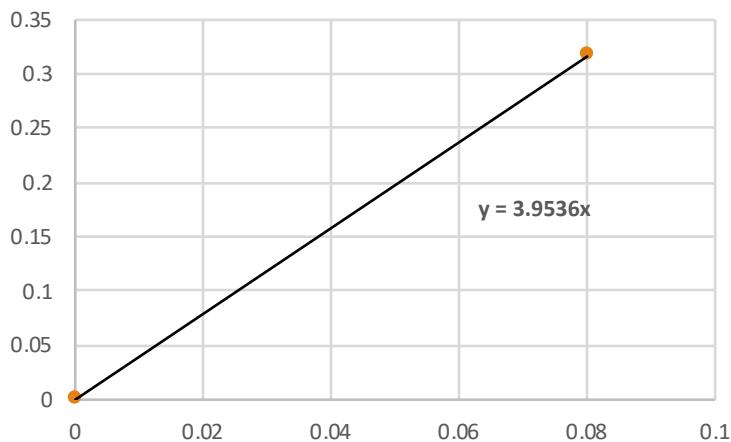

With a 1-point calibration curve, there should be no need to reprocess (aka re-analyze)

You can reprint chromatograms WITHOUT re-analyzing the data

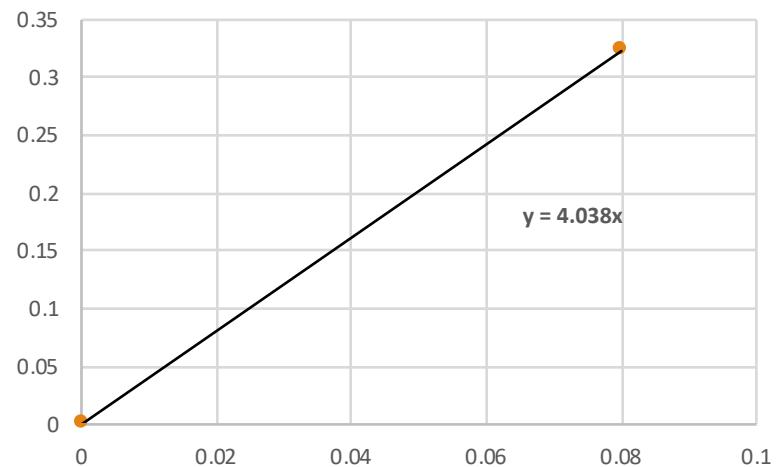

When you hear calibration curve, think equation:

- $y = mx + b$

February 2014 Calibration Curve

March 2014 Calibration Curve

Reanalyze: Takes existing data and plugs it into a new calibration curve (equation)

Printing Custom Reports

You can print custom reports in one of four ways:

- From within the Custom Report editor. To print a report from the Custom Report editor, use either the Print button in Print Preview, or print the report directly by right-clicking and choosing **Print** from the shortcut menu.
- To print the current custom report, choose **Reports > Print > Custom Report** from the menu bar.
- As a part of data acquisition or reprocessing. A custom report can be printed at the end of each analysis, at the end of a data acquisition run, and during or at the end of a sequence. Selecting the Print Method Reports option when starting a run, sequence acquisition, or reprocessing determines whether or not a method custom report is printed. No reports are printed unless this option is selected. Sequence reports are not printed unless the Print Sequence Reports option is selected.
- From a sequence run. In the Run Type, select the **Print additional reports** check box. Use this option to select report templates to print and to specify when you want the report or reports to print.

Note When opening an instrument **online**, the configured printer is remembered for that instrument regardless of the user. When opening an instrument **offline**, the configured printer is remembered for the user of that instrument.

Figure 242. Sample Run Type(s) window

How it actually worked (??)

Explained by Brady Mills at last meeting

Explained in further detail in QI-ELP-2018-419-BA

Many unanswered questions in QI on what exactly happened

Yet, still concluded - accidental

What was said

Data from February reused in March

Electronic data missing for all but 2 injections (should have been 108 total injections)

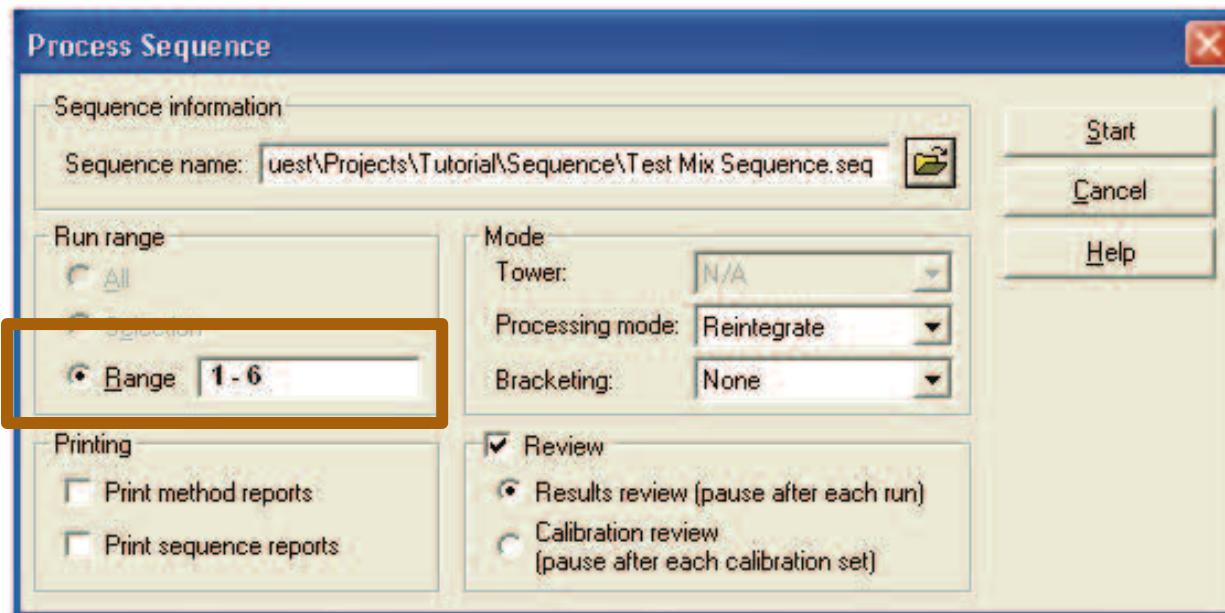

Hard copy (paper) data was missing for all but 4 cases but calibrator and controls present

Therefore, 28 cases were missing hard data ($28 \times 2 = 56$ pieces of paper)

Needed to reprint (NOT reprocess)

QI-ELP-2018-419-BA

"It appears she re-analyzed the entire 2/7/2014 run but excluded vials 1 and 2. Then she analyzed one sample three times from the March run and then the same sample twice from the February run. Then, she analyzed all of the 3/12/2014 samples including vials 1 and 2 twice."

QI-ELP-2018-419-BA

This is not entirely correct!

Sample ELP-1312-02059 (vial 15) was actually reprocessed **11 times** individually, **not including** the 3 times as part of reprocessing the entire batch

6 times allegedly from the 2/7/14 run and appearing in the ALR020714 folder
4 times allegedly from the 3/12/14 run and appearing in the ALR031214 folder

1 time allegedly from the 2/7/14 run but appearing in the ALR03142014 folder*

*this is the same date (3/14/14) the sample is being reprocessed. This data file was originally saved in folder ALR02072014 and since it is reprocessed from that location roughly 3 minutes later, the file in the 3/14/14 appears to have been an exact copy or labeled to appear as an exact copy

QI-ELP-2018-419-BA

The QAP failed to mention that the second aliquot of ELP-1312-02059 (vial 16) was re-analyzed 3 times individually (not counting the times reprocessed with the batch):

System 3/14/2014 3:28:58 PM DG3WKMH1

Sequence - Analyze Run 16 - C:\ChromQuest\Enterprise\Projects\Default\Data\BAC\ALRData\ALR020714\BAC_ALR020714_016.dat

System 3/14/2014 3:30:01 PM DG3WKMH1

Sequence - Analyze Run 16 - C:\ChromQuest\Enterprise\Projects\Default\Data\BAC\ALRData\ALR031214\BAC_ALR031214_016.dat

System 3/14/2014 3:31:22 PM DG3WKMH1

Sequence - Analyze Run 16 - C:\ChromQuest\Enterprise\Projects\Default\Data\BAC\ALRData\ALR020714\BAC_ALR020714_016.dat

And that vial 14, the blank before ELP-1312-2059 was re-analyzed 2 times:

System 3/14/2014 1:48:29 PM DG3WKMH1

Sequence - Analyze Run 14 - C:\ChromQuest\Enterprise\Projects\Default\Data\BAC\ALRData\ALR020714\BAC_ALR020714_014.dat

System 3/14/2014 1:48:58 PM DG3WKMH1

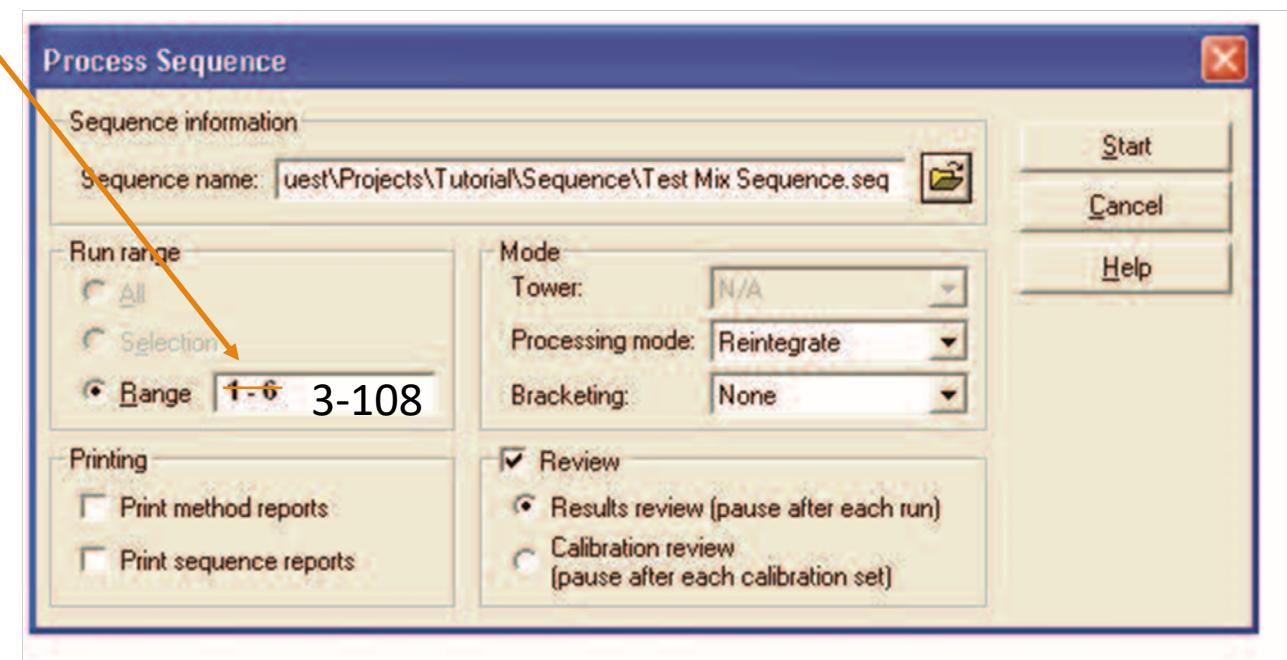

Sequence - Analyze Run 14 - C:\ChromQuest\Enterprise\Projects\Default\Data\BAC\ALRData\ALR020714\BAC_ALR020714_014.dat

When reprocessing the 2/7/14 batch on 3/14/14 she intentionally had to click the “range” Button and manually type in “3-108”. She intentionally omitted vials in positions 1 and 2 which correspond to a blank and the calibrator (which, if you reprocessed, would change the calibration curve (again)). Otherwise, she would have clicked the button “All”

System 3/14/2014 3:45:13 PM

DG3WKMH1

Run Queue - Add Sequence Process - Selection 3-108, - C:\ChromQuest\Enterprise\Projects\Default\Sequence\BAC Seq\ALRSeq\BAC_ALR020714_001.seq

QI-ELP-2018-419-BA

Their hypothesis contemplates 2-steps:

- 1) “It is possible during that entry that the analyst manually selected to apply the data set from 2/10/14 [2/7/14] instead of the data set from 3/12/14.”
- 2) “The analyst could have then had the software perform the analysis process against the wrong 2/10/14 [2/7/14] data set using the correct 3/12/14 data file .”

In other words, at some point the February data set must be “incorporated” into the March data set (by “right-clicking” on the graph and data and choosing wrong data set) AND the old data must be reprocessed.

Essentially – 2 different accidents must occur

With the exception of the samples being individually reprocessed, the entire batch reprocessing occurred via/through the sequence (re-batching).

The sequence is tied to the data and the data contains the calibration curve. By reprocessing/reanalyzing by selecting the sequence, you are telling the instrument to calibrate off of the calibrator in that sequence.

Each data file is being reprocessed in 1-3 seconds, as is typical when you batch reprocess. Even if you ignore the fact that the log shows that the entire run is being reprocessed as a batch, 1-3 seconds is not enough time to go into each individual data file and right click on the graph and then selecting the wrong data, as put forth in the QI/QAP.

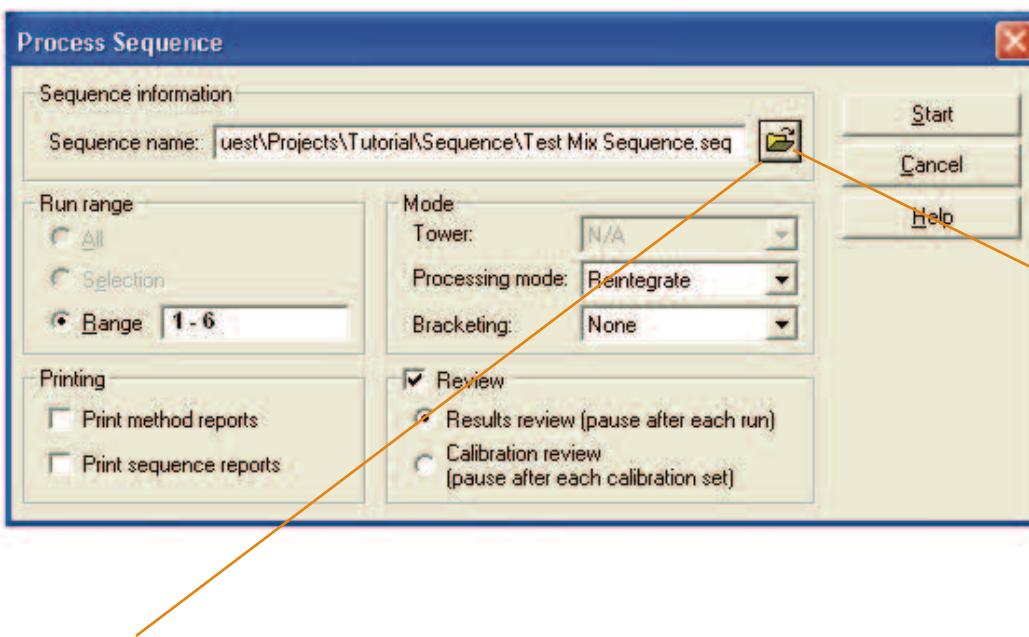

What they didn't say

Between 2/7/14 and 3/12/14, Romero had 2 completed runs and 1 partial run

These runs were dated 2/28/14, 3/7/14, and 3/11/14

Every time she “accidentally” grabs the wrong data, she must overlook several other data sets

Figure 193. Process Sequence dialog box, showing entries for reviewing your sequence

C:\ChromQuest\Enterprise\Projects\Default\Sequence\BACSeq\ALRSeq\BAC_ALR020714_001.seq
C:\ChromQuest\Enterprise\Projects\Default\Sequence\BACSeq\ALRSeq\BAC_ALR022814_001.seq
C:\ChromQuest\Enterprise\Projects\Default\Sequence\BACSeq\ALRSeq\BAC_ALR030714_001.seq
C:\ChromQuest\Enterprise\Projects\Default\Sequence\BACSeq\ALRSeq\BAC_ALR031114_001.seq
C:\ChromQuest\Enterprise\Projects\Default\Sequence\BACSeq\ALRSeq\BAC_ALR031214_001.seq

Does not explain everything

QI/QAP admits, the 2-step, “accidentally” grabbing the incorrect data two separate times (for 2/7/14 and for 3/12/14), hypothesis does not explain everything we’re seeing

However, acting intentionally would

DPS Conclusion

Despite numerous unanswered questions, DPS has concluded that the described acts are accidental. Their inability to look at the issues from all angles without considering the possibility of malfeasance is the exact reason an independent investigation is needed.

Additional Concerns

Another data file ALR031114_15.dat copied to the 3/14/14 folder and being re-analyzed

Several instances of “unsupported operations” being attempted and “required resources” being unavailable error messages on 3/14/14

Several instances of the method changing when there appears to be no logical reason for the change

A different QAP issued in 2017 and referenced in the QAP in question described 2 controls that, when calculated by hand, resulted in different values – one of which would have been outside the allowed tolerance (aka it failed). They chalk this up to a glitch that has never been seen before or since.

Summary - Not Accidental

Made a copy of at least one data file and placed it into a different folder

Manually entered reprocessing range omitting the calibrator

Reprocessed one case numerous times – going back and forth between Feb and March

Electronic data files have been deleted, but data files for runs prior to and after this date still exist

DPS contemplates not “an” but a series of “accidents” and individual selections to get what we see, which is not likely and no individual selections exist (except 2059)

C

Texas Forensic Science Commission Meeting

July 20, 2018

**Complaint No. 18.21; Culbertson, Amanda
DPS – El Paso, Blood Alcohol**

Incident Description

- Quality Incident QI-ELP-2018-0419-BA
- El Paso Laboratory notification on April 19, 2018 via the DPS Public Information Officer
- Laboratory Director notified of FSC complaint on April 20, 2018
- Complaint alleges falsification of data (drylabbing)

Incident Description

- DPS reviews and agrees there is an anomaly in data.
- Obtains objective evidence (instrument log) that samples were rerun.
- Chain of custody supports the samples were transferred from evidence coordination to analyst a second time for sampling.
- Because raw data files cannot be located for 28 of the 32 cases, DPS makes decision not to support data. Does not recommend retesting due to age of evidence (over 4 years).

Cause Analysis

- BA batch started Friday, 2/7/14 carrier gas became depleted and the run automatically stopped.
- Monday, 2/10/14 a new cylinder was installed and run restarted from stop point.
- Analyst printed results on 2/21/14, batch passed QC requirements, completed reports on 2/28/14.
- Cases were sent for technical review off-site (Midland DPS Lab).

Cause Analysis

- No policy exists to address data from a run where the carrier gas was depleted.
- Technical reviewer felt best practice to re-run the samples.
- The analyst set up a second run of the samples.
- Objective evidence includes:
 - Chain of custody shows Ms. Romero retrieved the evidence a 2nd time on 3/11/14.
 - Instrument logs show analysis sequence from 3/12/14 to 3/13/14 at 13 minute intervals for all 32 cases and controls.
 - The case records for 4 cases contained hard copy data from 3/12/18 run. No hard copy data from that run is present in the 28 cases.
 - Instrument automatically analyzes and prints data as it runs.
 - Hypothesize loss of printed data caused the analyst to manually initiate process to re-obtain data (manual print). Control data was retained.

Cause Analysis

- Objective evidence includes:
 - Analyst manually analyzed and reprinted data for 28 cases on 3/14/14. Software allows user to select data file to print; however printed data does not identify the file used.
 - Manually printed data for the 28 cases includes the 2/10/2014 data using the 3/12/2014 calibration.
 - This manually printed data was used for the final reports issued on 3/18/2014.
 - Peak areas were the same for both runs on paper, but with different calibration files, resulting concentrations differed.
 - Cases were technically and administratively reviewed on 3/21/2014 by original reviewer. The identical area counts were not noted between runs.

DPS Lab Further Review

- Previous batch (3/7/2014) interrupted by a power outage then re-run (3/11/2014). No identical peak areas in re-run data.
- A case folder from second analyst re-run reviewed. No identical peak areas in re-run data.
- Previous batch (10/21/2013) interrupted by a power outage then re-run (10/30/2013). No identical peak areas in re-run data.
- Data files archived on El Paso server are identical to recovered files from instrument computer.
- The original analyst and technical reviewer were interviewed via teleconference in order to assist in determining the cause.
- Met with the El Paso DA's office on 4/30/18 and 5/15/18, with follow up e-mails.
- Following a statistical sampling plan, 29 cases from separate batches worked by Ms. Romero were reviewed and the data was supported by the case record with no anomalies. Additional reviews are pending.

DPS Lab Changes Since 2014

- Instrument from 2014 is no longer used in the DPS El Paso Lab.
- The Lab system is using a consistent data processing method across the state.
- Two instrument platforms are used.

DPS Lab Changes Since 2014

- Current instruments have the data file path hardcoded on the chromatogram not allowing for data file confusion.
- DPS Lab Blood Alcohol Advisory Board met on June 4, 2018 to examine how verification of data should proceed.
- Blood Advisory Board is working to better define technical review process.
- Lab system is working on a standard process of the retention of raw data for our chemistry programs.

Conclusions

- DPS reviewed and agrees there is anomaly in data.
- There is objective evidence Ms. Romero re-ran the batch in question on 3/12/2014.
- It was confirmed that the software used for this instrument did not have controls in place to prevent the user from accidentally switching data files.
- This incident is believed to be isolated to this batch.
- There is no evidence to suggest this incident was intentional.

Previous CS Incident

- Transcriptional errors during weighing events (QAP 1030)
- No indication of technical incompetence
- Review of CS casework showed no nefarious intent.
- No weighing events in Blood Alcohol cases.
- No indication Blood Alcohol cases needed to be reviewed.

RE: Request for Interview of Client Ana Romero Regarding Texas Forensic Science Commission (“Commission”) Complaint #18.21 (DPS El Paso; Toxicology)

Dear Mr. Morales:

Pursuant to Tex. Code Crim. Proc. art. 38.01 § 4, the Commission is required to investigate allegations of professional negligence or professional misconduct that would substantially affect the integrity of the results of a forensic analysis conducted by an accredited crime laboratory and issue a written report on its findings.¹ Complaints are initially reviewed by the Commission’s Complaint and Disclosure Screening Committee, approved for investigation by a majority of a quorum of Commissioners, and investigated by an Investigative Panel of three or four Commissioners in preparation of a completed, written report.² Commission investigations may include collection and review of documents, contracts with subject matter experts, interviews with individuals and other action as appropriate.³

The Commission is currently investigating a report of a nonconformance involving your client, Ms. Ana Romero, that occurred during her employment at the Texas Department of Public Safety Laboratory – El Paso. A copy of the original complaint form filed with the Commission is enclosed with this letter. As part of its regular course of investigation, the Commission’s investigative panel requests an opportunity to interview your client with respect to the events and circumstances as described in the complaint.

¹ TEX. CODE CRIM. PROC. art. 38.01 § 4(a)(3); *Id.* at § 4(b).

² [Tex. Admin. Code § 651.304](#).

³ [Tex. Admin. Code § 651.307](#).

If you have any questions with regard to the investigation and/or the Commission's request for an interview, you may reach me directly at (512) 936-0661.

Respectfully,

Leigh M. Savage

Incident Description: A batch of blood alcohol samples was initially processed in the El Paso Crime Laboratory on Friday, 2/07/2014, by Ana Romero. Ms. Romero at that time was a blood alcohol analyst working for DPS. Ms. Romero no longer works for Texas DPS; she resigned from DPS employment for unrelated reasons on 5/31/2014. During processing of the blood alcohol batch on 02/7/2014, the carrier gas on the instrument became depleted, and the run automatically stopped. Ms. Romero, hereafter referred to as "analyst", "Ms. Romero", or by the initials "AR", returned to work on Monday, 2/10/2014, noticed the stoppage, added new carrier gas, and progressed the run from the point where it was stopped. The results were obtained on 2/10/2014. The controls on the run prior to and post cylinder replacement passed quality check (QC) requirements. No policy existed in the SOP at the time that addressed using data from a run where carrier gas is depleted, replaced, and allowed to continue. Since all controls passed and the test process was not prohibited, the analyst printed the results on 2/21/2014, draft completed the report in JusticeTrax on 2/28/2014, and it was sent it out for technical review off-site. The technical reviewer for the 2/7/2014 batch (who is also now a former employee) rejected the data from 2/10/2014 and requested that the samples be re-sampled and re-run, due to the carrier gas being exhausted over the weekend while the run was in progress. The technical reviewer felt it was best practice to re-run the samples under those conditions. The analyst complied with the technical reviewer's request. The chain of custody and instrument log indicates that the samples from 2/10/2014 were re-run by the analyst at the technical reviewer's request on 3/12/2014. However the printed data for only four (4) cases from that re-run was inserted into case folders, while the printed data from the remainder of the re-run cases (28) was not added to the case folders. On 3/14/2014, evidence is present in the instrument log to suggest that Ms. Romero returned to the instrument software and manually initiated an analysis process of the 3/12/2014 data. Rather than selecting the data from 3/12/2014, it is speculated that Ms. Romero was allowed by the software to select and use the data from the earlier 2/7/2014 run instead, and compare it against the calibration file from 3/12/2014. Ultimately, the data that was used on 3/14/2014 resulted in different concentrations than those obtained on 2/10/2014, but possessed the exact same peak areas in both runs. The final report marked draft complete on 3/18/2014 states that 3/12/2014 data was used, but instead it was data from 2/10/2014 that was used to generate the report. On 2/10/2014, the 2/10/2014 data was originally compared to 2/10/2014 calibration files and generated one concentration. On 3/14/2014, the 2/10/2014 data was again used (misrepresented as 3/12/2014 data) but was compared to the 3/12/2014 calibration file. This caused the peak areas to be the same between the two runs, but because each run applied a different calibration file, the resulting concentrations in the runs differed. The new reports were marked draft complete on 3/18/2014. They were technically and administratively reviewed on 3/21/2014 by the same reviewer that had originally rejected the initial data. Ultimately this incident affected 28 cases included in the batch. The laboratory became aware of this incident by being notified by external sources on 4/19/2018. On 4/19/2018, the El Paso Lab Manager was contacted by PIO officer about a news story involving former employee Ana Romero. Additionally, Mayr Law published similar information on their website (http://mayr-law.com/badblood/). On 4/20/2018 Crime Laboratory Service Director was notified that the Texas Forensic Science Commission received a complaint consistent with the allegations.						

Cause Analysis:

ROOT CAUSE INVESTIGATION A thorough process was performed to determine the causal factors in this incident. The following were conducted: 1. Initial Review of Additional Cases and Data from the El Paso Blood Alcohol Unit - The data files from the now-retired Thermo instrument used during the original analysis are still stored on the El Paso server. The Technology Integration Analyst was provided the location of the data file backup. He reviewed the retired instrument computer and indicated that both the software (no longer in use) and original data files were stored on the hard drive and are still recoverable and readable. He noted that the data files backed up to El Paso Server are identical to what is on the retired instrument computer. The data was backed up to the server when the instrument and computer was retired. As part of the cause analysis investigation, a selection of case folders involving multi-run cases performed around the same time as the batch involved in this incident were reviewed and no repeats of the issue were identified. This included 10/21/2013 and 3/11/2014 batches from analyst AR, and another batch from a separate analyst MA on 3/27/2014. Detecting no issues in these batches supports the idea that the incident was not caused by a default software setting that is associated with re-runs. A case folder was reviewed from batch 3/7/2014 (AR) which was interrupted by a power outage. It was rerun on 3/11/2014.

by AR and the data is supported by the case record; no identical peak areas were detected. A case folder from a batch rerun by another analyst (MA) that had to be rerun twice (3/24/2014, 3/26/2014, 3/27/2014) was reviewed, and the data is supported by the case record. No indentical peak areas were detected. This also suggests the incident was not caused by a default software setting associated with reruns. Two case folders were reviewed from batch 10/21/2013 (AR) which was interrupted due to power outage and was rerun on 10/30/2013. Data from the first run was not present in the two case files; it could be the instrument stopped prior to injection. There was sufficient data in the record to support the reported conclusions from the second run. Two single run batches (one from each analyst working at the time) were reviewed. The 1/6/2014 batch (AR) and a 2/3/2014 (MA) batch reviewed were all single run batches and the data from one case folder per batch is supported by the case record; there were no identical peak areas. The 3/11/2014 batch record and case file for ELP-1312-02207 were received and reviewed 4/26/2018 by the Toxicology Section Supervisor. No additional information was obtained.

2. Initial Review of Raw Data in the Batch Affected - The El Paso Lab Manager checked the discovery record and found only the copies of the 02/07/2014 files modified in 03/2014 on the CD of files released for discovery. The El Paso lab manager checked the discovery CDs and the CD contains all of the data files for the 3/12/2014 run. The data files provided show a modification date of 3/14/2014 but the file name includes 2/7/2014. The Technology Integration Analyst confirmed that the raw data files from the 02/07/14 run matches what is in the case record. There are only 2 injections from the 03/12/2014 run saved on the computer (positions 15 and 16; case ELP-1312-02059). The directory name for these files are not consistent with Ms. Romero's usual naming configuration. Looking for the remainder of the data files, it appeared to the Technology Integration Analyst that the recycle bin had not been emptied since 2010 (files were present with 2010 dates in the bin). There is no run data matching the 03/12/2014 run in the recycle bin. There are sequence logs back to 2009 for the analyst AR but the data does not go back that far including what is present in the recycle bin. The Technology Integration Analyst investigated data back to 2009, and discovered that while deletion of data had occurred over a period of time and was not uncommon, no policy was in place from 2009-2014 to require the preservation of this data. Local IT suggested a file undelete utility and the ADD approved its use. The file undelete tool was used and 832 files were recovered. The instrument log was recovered which indicates the sequence in question was run on 3/12/2014 beginning at 2:57:22 PM and ending on 3/13/2014 at 1:20:59 PM. Regarding at the only two injections from the 3/12/2014 run that were available digitally for review, the peak areas from the raw data of the two injections present are (case ELP-1312-02059): 16 = 2348104 and internal standard = 2091578 channel 1; 16 = 2327450 and internal standard = 2031460 channel 2; 15 = 2395513 and internal standard 2129966 channel 1; 15 = 2307149 and n-propanol 2057731 channel 2 The peak areas listed above are not what was printed in the case folder. There are no blank or calibrator files present in the 3/12/2014 data folder but the paper copies are in the batch record and could be used to obtain the appropriate ethanol concentrations for the one case. The other files involved in the batch can not be located. The data file names on the 3/12/2014 chromatogram printouts in the case record are not consistent with the data pathway on the computer. The next run saved on the instrument computer is 4/23/2014 by AR and it includes only proficiency test samples. After that there are no more AR folders. The Employee's (AR's) separation date was 5/31/2014.

3. Review of data on EL Paso Server - Ms. Romero's home directory has been deleted (as would be expected post-resignation). Ms. Romero's files within "public" were related to supply orders or reagent prep logs. There were also GCMS data files and sequence logs. All of Ms. Romero's files within El Paso Lab Documents were the data files previously identified in QA data BA and GCMS files.

4. Review of data on the other GC instrument (Shimadzu) - Files containing Ms. Romero's initials ALR were found with a search from c:\, and they were internal standard data files from 03/21/2013 and 03/07/14. No files with a modification date of 03/12/2014 were found, and no files with a creation date of 03/12/2014 were found.

CAUSE ANALYSIS Cause analysis proceeded, and multiple contributing factors were discovered or hypothesized. These are numbered below:

1. Employee Oversight Possible, but No Dry Labbing Occurred – The batch records of the 3/12/2014 batch (which was a rerun of the 2/07/2014 batch) were reviewed by subject matter experts in Austin who reviewed the identical peak areas between the 3/12 and 2/14 batches on the printed chromatograms in some but not all cases in the batch. They agree that it is a statistical impossibility to possess two different runs with identical peak heights and different concentrations of ethanol. However the method blanks, calibrators and controls area counts are different suggesting at least the blanks and some of the samples were rerun. Chain of custodies were reviewed in the batch and confirmed that the items were transferred back to the analyst again in March, presumably for testing. Evidence indicates that the analyst took possession of those items, testing was performed on 3/12/2014, and the evidence was returned. The instrument log indicates the instrument collected and analyzed files on 3/12/2014 in 13 minute increments from the batch in question. This evidence refutes the theory proposed by the filed compliant suggesting that the samples were dry-labbed. Dry-labbing occurs when results are fabricated in lieu of performing an experiment, and in this case an experiment was clearly performed. The evidence indicates more likely that analyst oversight occurred, presumably by the analyst applying 2/10/2014 data in a way that caused it to be misrepresented as 3/12/2014 data. The reason for the improper application of data is not known. A meeting with Ms. Romero was held on 6/07/2018 to attempt to gather additional information on the cause for the improper data application. Ms. Romero, her attorney, Austin Toxicology Supervisor Anna Mudd, El Paso Lab Manager Joseph Correa, Crime Lab Director Brady Mills, Technical Services Director Alice Amilhat, and El Paso QA Specialist Kevin Condel were in

-----	--	------------	--	-----------------	-----------	-------------

attendance. Ms. Romero mentioned that the software was not user friendly, samples would not print properly, and the process was not intuitive. But since the case was run four years ago, ultimately the analyst was not able to provide a reason why the 2/10/2014 data was used during the 3/12/14 run.

2. Instrument Software Limitations - The instrument software allows one to select and use data from any run and apply it to any calibration file. According to the Texas DPS Technology Integration Analyst investigating the root cause for this incident, on the report template in the instrument software the user can select the graphs and the tables and tell the software which data file to use. Afterwards the software does not change what the upper header on the report is displaying, and also does not display the calibration file used. It is possible to select the wrong data file and afterwards not know the wrong file had been selected because no information was printed to identify what was chosen.

3. Analyst Data Analysis Process - An interview with a current employee who used this instrument in the past determined that the software automatically analyzes the run in progress and prints reports without user interface. The run was automatically analyzed on 3/12/2014 and printed. The correct controls and method blank chromatograms were archived with the batch, and chromatograms from four of the cases in the batch run on 3/12/2014 were inserted into the case folders. But 28 of the cases did not receive chromatograms. It is not understood what happened to the remainder of the printed data from the 28 cases. It is hypothesized that Ms. Romero returned on 3/14/2014 and initiated an analyze process to re-obtain the data, which would require her to manually select the data sets to be used. Evidence of this is captured in the instrument log. It appears she re-analyzed the entire 2/7/2014 run but excluded vials 1 and 2. Then she analyzed one sample three times from the March run and then the same sample twice from the February run. Then, she analyzed all of the 3/12/2014 samples including vials 1 and 2 twice. If Ms. Romero infrequently performed this type of manual initiation of the analyze process, it is possible that the wrong batch could have been selected on accident during this process.

4. Possible Error in Data Set Selection - The analyst entered the data on 3/14/2014 to manually initiate an analysis process. On the report template in the instrument software, you can select the graphs and the tables and tell it which data file to use. It does not change what the upper report is displaying. When you open the report, it will display the first data file path you use. But you can right click and change out the graphs and tables individually by pointing to a different data path. It is possible during that entry that the analyst manually selected to apply the data set from 2/10/2014 instead of the data set from 3/12/2014. The analyst could have then had the software perform the analysis process against the wrong 2/10/2014 data set using the correct 3/12/2014 calibration file. This is one path that could have yielded results that were identical in peak area to the 2/10/2014 run (because they used the same data set) but had different concentrations (because they applied to different calibration files). Since the data set is able to be changed during the manual entry, but that action is not reflected on the printout, The wrong data set could have been selected by accident and not been noticed by the analyst or the reviewer. However, this still does not fully explain the 4 cases in the batch that did show different peak areas between the 2/10/2014 and 3/12/2014 runs.

5. Technical Reviewer Oversight - The technical reviewer did not check the peak areas on the 3/12/2014 re-run, and may have only checked that the concentration was a different value than was obtained on 2/10/2014. As a result, the technical reviewer did not detect that an error had occurred during analysis. It is likely that on 3/14/2014, the analyst involved in the original process applied the 2/10/2014 data in place of the 3/12/2014 data during a manual initiation of the analysis process, causing inaccurate information to be generated for the 3/12/2014 run.

Correction(s) to the Original Work (Indicate if not performed at this time)**Corrected Report? NA**

1. Former Employee Contacted to Request Explanation - The Assistant Division Director (ADD) contacted Ms. Romero via her work phone on 5/4/2018. He explained that a question has arisen about a batch of BA casework she worked on. The ADD asked for an email address to email data for her review. The ADD explained that her assistance was needed to help support her results and discussed the existence of the associated Texas Forensic Science Commission complaint. Ms. Romero asked for the ADD's direct number and did not wish to comment prior to consulting with an attorney. Ms. Romero obtained litigation, and per the direction of the Crime Lab Director, Ms. Romero's attorney was contacted via e-mail on 5/16/2018 by the El Paso Laboratory Manager and forwarded the case notes for the 32 affected cases. Ms. Romero was asked to review the data and a meeting would be held at a later date to discuss the review. After ample time for review had passed, a meeting with Ms. Romero was held on 6/07/2018 to attempt to gather additional information on the cause for the improper data application. Ms. Romero, her attorney, Austin Toxicology Supervisor Anna Mudd, El Paso Lab Manager Joseph Correa, Crime Lab Director Brady Mills, Technical Services Director Alice Amilhat, and El Paso QA Specialist Kevin Condel were in attendance. Ms. Romero mentioned that the software was not user friendly, samples would not always print properly, and the software process was not intuitive. But since the case was run four years ago, ultimately the analyst was not able to provide a reason why the 2/10/2014 data was used during the 3/12/14 run.

2. Review of Additional Cases to Determine Scope of Errors - On 4/26/2018, LIMS support provided a case list, showing that 2210 Blood Alcohol cases were worked by Ms. Romero. The case list was sent to El Paso Lab Manager, his supervisor and ADD Mills for distribution to DA's office (requested by Trial Chief Lori Hughes) 4/26/2018. Folders were requested from previous multi-run cases of both analysts working around that time in El Paso. A selection of case folders were reviewed and no repeats of the issue were identified (see Cause Analysis section #1 in this Quality Incident Report). It was concluded that the issue was not caused by a default software setting associated with reruns. As a part of future corrective action, the El Paso lab and DPS will contact

Lab		Discipline		Date Discovered	4/19/2018	Page 4 of 4
-----	--	------------	--	-----------------	-----------	-------------

the Texas Forensic Science Commission (FSC) to determine an appropriate and representative sample size to review in order to determine whether the issues uncovered during root cause analysis are also present in the greater body of Ms. Romero's work. DPS will review a representative sample of Ms. Romero's work and review prior employee evaluations in an effort to determine whether this incident was isolated or had been identified in the past. While other instances involving issues detected during peer review of Ms. Romero's work are documented (see QI-ELP-2017-0608-BA and QI-ELP-2017-0831-BA), neither were believed to be linked to a larger pattern of error. With this current incident, it becomes apparent that further investigation must occur to determine whether additional errors in other cases may be present.

3. Conclusions regarding affected Samples - Because the technical reviewer did not support the results of the first run, the department will not issue amended reports using the first batch's data. Additionally, since the second batch appears to have been analyzed using the data from the first batch, those results are invalid. Since four years has passed since the samples were collected, some samples may be unsuitable for reanalysis. Additional investigation is in progress to determine if the blood alcohol evidence for the 28 cases affected have been refrigerated post-analysis and to determine whether the evidence is in storage in El Paso or has since been returned to the customer.

4. Conditions on Repeatability in Future Work - A. Analysts - The analyst Ms. Romero, who performed the work initially, is no longer employed and has not been employed with DPS since 5/31/2014. The technical reviewer is also no longer employed with the DPS laboratory. Therefore, corrections to personnel performing work or review on the cases affected by this incident are no longer possible.

B. Instruments / Software - The instruments / software used to generate the results in the affected cases in this incident are no longer used. Regarding the instrumentation / software used in current casework, the vendor had confirmed through an e-mail obtained from 8/11/2017 that the data file path is hardcoded to stay the same regardless of whether the data is renamed, stored or moved when BAL reports is used. This process is the same for all of the BA labs except for Austin. However the Austin instrument's software works similarly in that there is an audit trail that points back to the file that was used. Therefore, a future repeat of the events that led to this is not possible with current technology in place.

C. Re-Analysis Data Verification - A Blood Alcohol Advisory Board meeting was held on 6/4/2018 and discussed how verification of data should proceed during technical review. Since this incident was discovered as a result of re-analysis data verification being performed on a case, more universal approaches may be developed to address how to identify and respond to instances such as these.

Customer Notification (Indicate if not performed at this time or not applicable):

The case list was sent to El Paso Lab Manager Joseph Correa, his supervisor, and Crime Lab Director Brady Mills for distribution to DA's office (requested by the Trial Chief) on 4/26/2018. A meeting was held at the El Paso District Attorney's office on 5/15/2018 to discuss this incident. Division Director Mike Lesko, Crime Lab Director Mills, El Paso Lab Manager Joseph Correa, the District Attorney, First Assistant, Trial Division Chief, Intake Division Chief, and Drug Task Force Chief were all present. The submitting agency or representative for each case affected should be contacted and provided a description of the events leading to this incident. This should be documented and added to the case notes for each case upon completion.

1. The El Paso lab and DPS will contact the Texas Forensic Science Commission (FSC) to determine an appropriate and representative sample size to review in order to determine whether the issues uncovered during root cause analysis are also present in the greater body of Ms. Romero's work. 2. DPS will review a representative sample of Ms. Romero's work and review prior employee evaluations in an effort to determine whether this incident was isolated or had been identified in the past. Note: Since the analysts involved no longer work at DPS, the instrument and software involved are no longer utilized, and the process itself includes an audit trail, a preventive response to minimize these types of incidents in the future is not currently applicable. Actions related to this incident will primarily focus on review of prior cases to determine if any additional limitations exist in Ms. Romero's prior casework.

Plan ApprovalApprover(s) Gomez, Marissa Silva, Condel, Kevin, Correa, Joseph (electronically signed) Date: 10/3/2018

Corrective Action Items and Preventive Measures		Work Authorization Suspension? None
Date Completed	Action Item/Preventive Measure	Responsible Individual
08/30/18	The El Paso lab and DPS contacted the Texas Forensic Science Commission (FSC) to determine an appropriate and representative sample size to review in order to determine whether the issues uncovered during root cause analysis are also present in the greater body of Ms. Romero's work. On 08/30/18, the recommendation was received that El Paso to look at one case from each batch.	Correa, Joseph
10/03/18	On 8/30/18, El Paso DPS began a review of a representative sample of Ms. Romero's work and review prior employee evaluations in an effort to determine whether this incident was isolated or had been identified in the past. The review concluded on 10/3/18. The El Paso DPS laboratory manager reviewed a representative sample (314 cases out of 85 batches) of Ms. Romero's work (see attached spreadsheet) in an effort to determine whether this incident was isolated or had occurred in the past. The amount of reviewed cases exceeded the recommended amount proposed by the Texas FSC. The review of 314 cases (85 batches) of Ms. Romero's casework spanning from 2009-2014 did not produce any additional cases containing duplicated area counts matching those of other cases that were reviewed. It appears from review that this incident was isolated.	Correa, Joseph

Notes:

1) Method blanks for 2/7/14 and 3/12/14 batch are different area counts

2) ELP-1312-02063 - the runs are switched. On the data, the area counts for the 2/7/14 Run 1 are recorded for the 3/12/14 Run 2

3) ELP-1312-02058 - the first runs for both sets of data are the same, but the second runs are different

4) ELP-1312-02072, ELP-1312-02080, ELP-1312-02082, and ELP-1312-02084 are highlighted green because they are the cases that had different area counts for all runs and channels.

Summary

Corrected Report Issued NA Yes

This supplement is being written in response to the Texas Forensic Science Commission inquiry.

It is the laboratory's belief based on our review of the contributing factors below, there was not an intentional or malicious action on the part of the analyst. We feel the evidence refutes the claim of drylabbing, however we cannot exclude the possibility that the actions on the part of the analyst were intentional. Ultimately the root cause for this incident was inconclusive.

The root cause analysis identified several contributing factors for this quality incident:

1 Employee oversight- The chain of custody and instrument log both indicate the evidence for the affected batch was returned to the analyst and the instrument collected and analyzed files on 3/12/14 in 13 minute increments. The most likely scenario has the analyst using the 2/10/14 data in a manner that allowed it to be misrepresented as the 3/12/2014 run. The reason this occurred could not be determined.

2 Instrument Software limitations- The software used at the time of this incident allowed the user to manually select a data file and would not update the upper header on the report, or identify the calibration file used. There was nothing present in the software to prevent the user from accidentally switching data files. This limitation in the software could be associated with either accidental error or intentional error act.

3 Analyst data analysis process- 28 cases did not receive chromatograms, the software generated reports without user interface. It could not be determined if the reports printed and if so what happened to the printed data, however the instrument log captured the analyst manually initiating an analyze process to re-obtain the data and print/re-print the chromatograms. This specific process was infrequently performed.

4 Possible error in data set selection- As mentioned above the user can select the graphs and tables and tell the software which data file to use. It is likely the analyst manually selected the 2/10/14 data set and ran it against the correct 3/12/14 calibration file which would have yielded the results found (IE identical peak areas with different concentrations)

5 Technical reviewer oversight- The technical reviewer did not check the peak areas on the re-run and may have only checked the concentration was different between the two runs. As a result the error was not detected.

The El Paso laboratory reviewed a representative sample (315 cases out of 85 batches) of the analysts casework spanning 2009-2014. No other cases with duplicated area counts were identified. From our review it appears this incident was isolated to the batch in question, and none of the analysts other casework outside this batch was affected.

A comparison was made of the linear regressions from the February and March calibrations. Please refer to the attached spreadsheet. The area counts from the 2/7/14 batch were used to calculate the concentration using the original curve. Then the area counts used on the 3/12/14 batch (most of which match the 2/7/14 information except for the highlights) were used to calculate the concentration using the curve from 3/12/14. The spreadsheet calculates the percentage difference between the two sets of results to show the difference between the two curves.

The software used on the recovered PC was EZChrome Elite Version 3.2.1 Build 3.2.1.31. The instrument was not recovered. Without the instrument, our technology integration specialist could not reproduce how the software would react while reprocessing and collecting data at the same time. We know a sequence from another analyst was running and collecting data at the same time the analyst in question was reprocessing the 3/14/14 batch. When reprocessing a sequence, it was noted the computer defaults to the original results unless the user selects reintegrate. The results would then be calculated using the calibration currently saved in the method. From the software logs and menu choices, we can surmise how the calibrator from a different run can be used to process the current run if Reintegrate is chosen when reprocessing the sequence and the calibration was previously saved to the method. Whether the analyst was aware that her actions were causing the calibration from a different run to be used is unknown.
